

PATIENT REFERRAL DOCUMENT

LMU Klinikum Munich

Patient: Monika Gruber

Date of Birth: 17.06.1982

Date: 15.05.2026

Referring Physician: Dr. Petra Weiß

General Practice Haidhausen, Munich

REASON FOR REFERRAL:

Patient presents with a 14-month history of worsening plaque psoriasis affecting the scalp, elbows, knees, and lower back. Previous management with topical corticosteroids and vitamin D analogues has provided only partial and temporary relief. Quality of life significantly impacted. Requesting dermatology review for assessment of eligibility for systemic or biologic therapy.

SKIN EXAMINATION FINDINGS:

Multiple well-demarcated erythematous plaques with silvery scale
Scalp: Diffuse scaling with plaques extending beyond hairline
Elbows: Bilateral, confluent plaques approximately 6cm diameter each side
Knees: Bilateral, thick plaques with significant scaling
Lower back: Large plaque approximately 15cm by 8cm
Nail changes: Pitting noted in multiple fingernails, no onycholysis
No evidence of psoriatic arthritis on joint examination
No pustular or erythrodermic features
PASI score estimated at 16 · moderate to severe disease

CURRENT MEDICATIONS:

Betamethasone valerate 0.1% cream · applied to body plaques twice daily
Calcipotriol cream · applied to body plaques once daily
Coal tar shampoo · used three times weekly for scalp
Cetirizine 10mg · taken as needed for itch
Ibuprofen 400mg · occasional use for discomfort

PREVIOUS TREATMENTS TRIED:

Topical corticosteroids · partial response, rebound on stopping
Vitamin D analogues alone · minimal response
Combined betamethasone and calcipotriol · partial response, not sustained
Phototherapy · not yet tried, patient interested in this option
No previous systemic therapy

PAST MEDICAL HISTORY:

Plaque psoriasis · diagnosed 2016
Mild anxiety disorder · managed with psychological therapy, no medication
No inflammatory bowel disease
No previous skin infections requiring hospitalisation
Vaccination history up to date

FAMILY HISTORY:

Mother · plaque psoriasis, managed with topical therapy
No family history of psoriatic arthritis or inflammatory bowel disease

SOCIAL HISTORY:

Works as a secondary school teacher

Non-smoker

Alcohol · 6 units per week

Married with one child aged 4

Highly motivated to improve skin condition

Reports significant psychological impact · avoids swimming and social situations involving exposed skin. Has taken time off work due to embarrassment and discomfort during flares.

INVESTIGATIONS:

Full blood count: Normal

LFTs: Normal · relevant if methotrexate considered

Renal function: Normal

HBsAg: Negative

HIV: Negative · tested with patient consent

Quantiferon TB Gold: Negative · relevant if biologic therapy planned

ANA: Negative

CLINICAL IMPRESSION:

Moderate to severe chronic plaque psoriasis with significant impact on quality of life and psychological wellbeing. Inadequate response to optimised topical therapy over 14 months. Patient is an appropriate candidate for assessment regarding phototherapy, systemic therapy such as methotrexate or acitretin, or biologic therapy. Pre-biologic screening investigations have been completed in preparation for this referral. Patient is well informed and motivated.

Urgency: Routine · please see within 2 weeks.
